

Bug Report: Application Usability Analysis

Introduction

This document outlines several usability issues identified in the application, based on a review of screenshots and user feedback. The following sections detail each issue and provide recommendations for improvement.

1. Missing Direct Media Capture Functionality

Issue: The application does not allow users to record a video or take a photo directly from within the app. The current “Téléverser un fichier” option is limited to uploading existing files from the device’s storage.

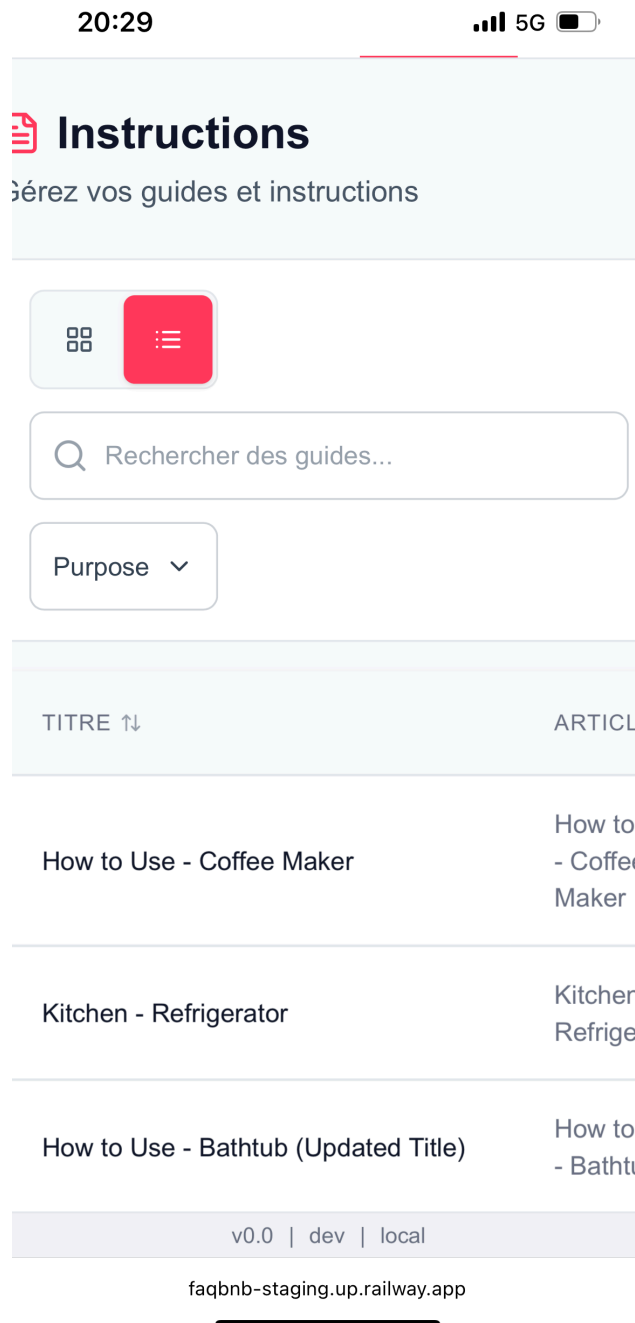

Recommendation: Implement direct media capture functionality to allow users to take photos and record videos without leaving the application. This will significantly improve the user experience.

2. Inefficient List Item Editing

Issue: To edit an item in a list, the user must scroll horizontally to find and click an “Edit” button. The list items themselves are not directly tappable for editing.

Recommendation: Enhance usability by making the entire row of a list item a tappable element that initiates the editing process. This removes the need for horizontal scrolling and makes the interface more intuitive.

3. Inability to Add a Guide from the Item Details Screen

Issue: On the item details screen, there is a section for associated “Guides.” However, if no guides exist, there is no clear call-to-action for the user to add one directly from this view.

Recommendation: Add an “Add Guide” button or link within the “Guides” section on the item details page. This will streamline the workflow for users who want to create

and associate a guide with a specific item.
